

# Strategic Management of Harmful and Nuisance Algal Blooms Series

## Managing the Impacts of Algal Blooms in Drinking Water Treatment Plants

October 16, 2019

# CWN Webinars

Connecting water professionals to decision-ready knowledge

# Insights for the water sector

## helping decision-makers move forward

Canadian Water Network frames what is known and unknown in a way that usefully informs the choices being made.

[cwn-rce.ca](http://cwn-rce.ca)

# Algal Bloom Impacts

- Human health
- Drinking water treatment plants
- Flora and fauna
- Recreational use
- Local economies

# Algal Blooms in Canada

- A recurring issue for municipalities
- The severity, frequency & geographical distribution are increasing
- Increases are driven by human activities and climate change
- Difficult to determine extent and costs of algal blooms on a national scale

## Factors causing algal blooms

- Nutrients
- Light
- Temperature
- Water circulation
- Competition with and predation by other organisms
- Salinity

## Factors causing algal blooms

- Nutrients
- Light
- Temperature
- Water circulation
- Competition with and predation by other organisms
- Salinity

## Factors exacerbating algal blooms

- Climate change
- Human activities

## Factors causing algal blooms

- Nutrients
- Light
- Temperature
- Water circulation
- Competition with and predation by other organisms
- Salinity

## Factors exacerbating algal blooms

- Climate change
- Human activities

**Complete understanding of local contributing factors + holistic management approach**

# Webinar Speakers

**Arash Zamyadi**

Research Project Manager at Water Research Australia and Adjunct Academic Fellow at the University of New South Wales

**Ron Hofmann**

Professor in Civil Engineering at the University of Toronto and NSERC Associate Industrial Research Chair in Technologies for Drinking Water Treatment

**Scott Bindner**

Vertical Market Manager at Trojan Technologies

# Harmful algal and cyanobacterial blooms: Water supply systems and management options

**ARASH ZAMYADI, PH.D.**

**WATER RESEARCH AUSTRALIA (WATERRA) MELBOURNE**

# Treatment Strategies in the Plant

# 1999 City of Toronto response to severe T&O

Powdered activated carbon (PAC) preferred, but...

Plant	T&O control strategy
R.L. Clark	PAC
F.J. Horgan	PAC: direct filtration train Sand/GAC filters: in-line filtration train Ozone in 2009
R.C. Harris	Sand/GAC filters

# PAC experience

Silo system at Clark WTP

From City of Toronto

# PAC experience

Supersacs at Horgan WTP

From City of Toronto

# PAC experience

- Clumping in Supersacs, silo slurry flow
- 24 bag changes per day
- 50% more coagulant needed → filter runs < 12 hrs
- 2X treatment cost (\$4.50/ML → \$10/ML)
- 5X more solids in residue management  
(upflow clarifier)

...but it worked

# PAC experience at Union Water Supply System

- 1.5 mg/L PAC year round
  - Helps to add mass to upflow clarifier
  - Up to 4 mg/L during T&O
- Delivered 3 times/yr, stored in outdoor slurry
- Added to flow with peristaltic pumps

scrubber

slurry mixer

PAC delivery

slurry tank

# Granular activated carbon (GAC)

- Often a layer above sand in a conventional filter (retrofit for anthracite)
- Typically 8-12 min empty bed contact time
- Gets saturated even in absence of T&O events due to background organic matter
  - **When to replace?**

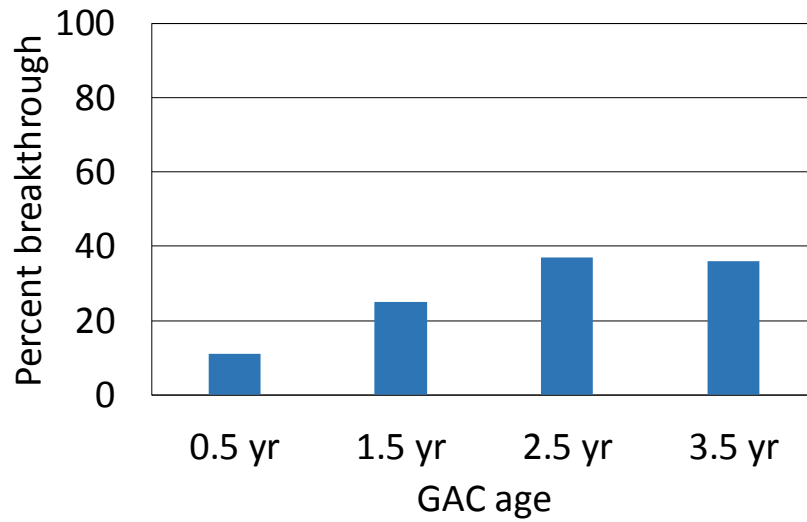

# Lake Ontario WTP

Minicolumn  
(lab) test

MIB

Geosmin

# Lake Ontario WTP

Minicolumn  
(lab) test

MIB

Geosmin

Reaching steady-state: **biodegradation?**

# Does GAC/PAC remove **cyanotoxins**?

- Yes, but...
  - performance mostly assessed during research and not during normal operations
  - most data for microcystin: little for other cyanotoxins (anatoxin-a, cylindrospermopsin, etc.)

# Ozone

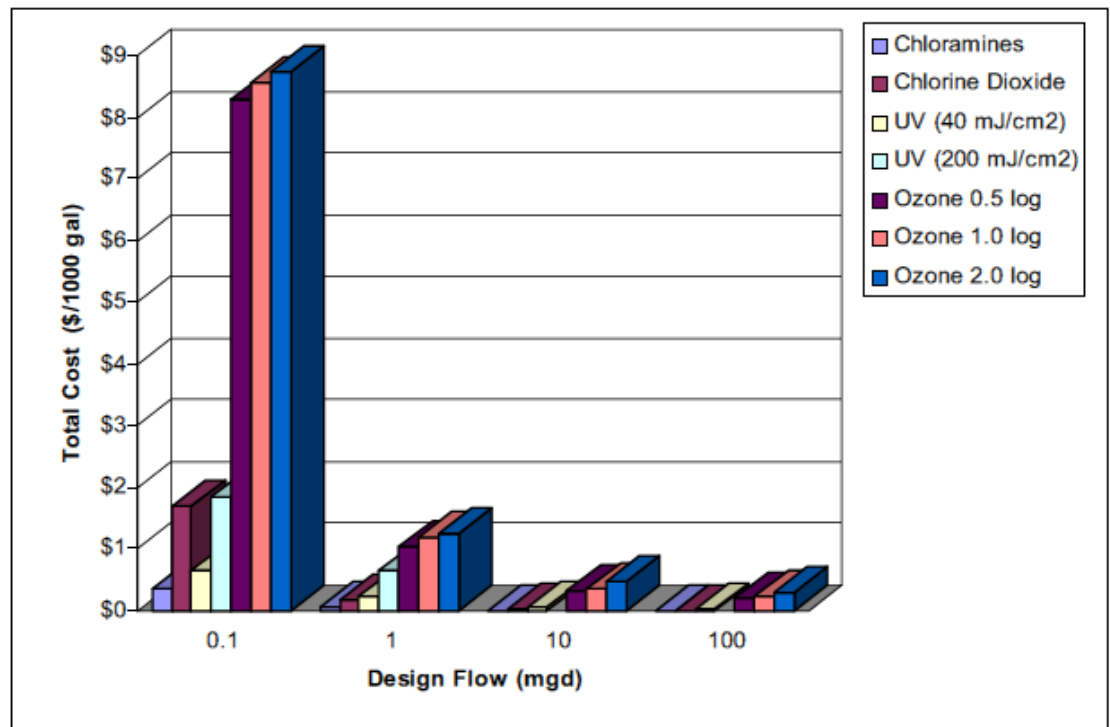

- Effective against cyanotoxins
- Often used for concurrent T&O control and *Cryptosporidium* control

# USEPA cost document for *Cryptosporidium* (2005)

- Assumed design ozone doses around 4-8 mg/L
- Since then: doses typically around 2-4 mg/L work well (IOA Municipal Committee)

Figure ES.1 Cost Comparison for Alternative Chemical Disinfection Strategies<sup>1</sup>

# Consider other benefits of ozone

5. Gwinnett County's First Ozone Experience: Rationale, Design, Start-up, and Lessons Learned presented at the IOA-PAG 2005 Annual Conference *Resolving Emerging Issues*, Lake Lanier Islands, Georgia, October 9-12, 2005

Courtesy IOA Municipal Committee

Ozone may provide other benefits and cost savings

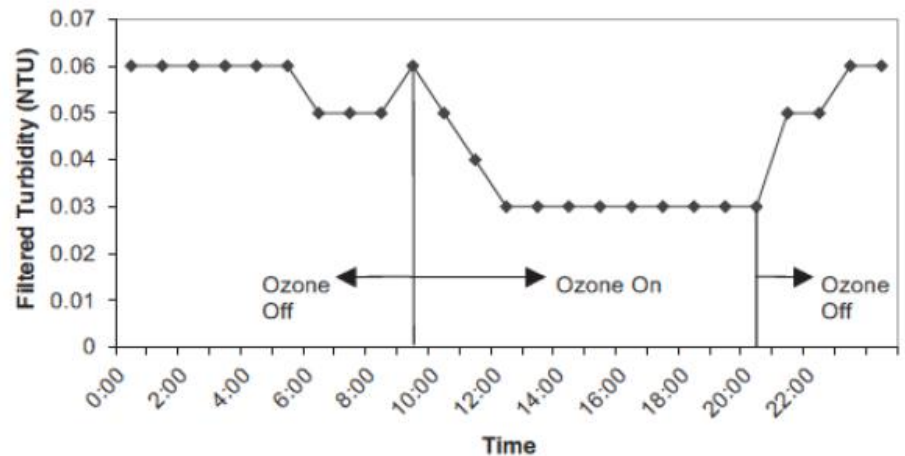

TABLE II Chemical Cost for the Year Before Ozone and After Ozone Implementation

Chemical	Prior to ozone cost June 2000–May 2001 (\$)	After ozone cost June 2001–May 2002 (\$)	Difference in cost (\$)
Alum	573,445	693,503	+120,058
Poly aluminum chloride	126,806	0	-126,806
Total coagulant cost	700,251	693,503	-6,748
Magnafloc LT-22	30,454	24,150	-6,304
Chlorine	109,153	109,347	+7,194
Powder activated carbon	493,500	0	-493,500
Ozone	0	251,394	+251,394
<b>Total</b>	<b>1,326,553</b>	<b>1,079,354</b>	<b>-247,964</b>
Water flow (ML/year)	59,814	61,188	+1374
<b>Unit volume cost (\$/ML)</b>	<b>22.17</b>	<b>17.62</b>	<b>-4.55</b>

**21% reduction of total chemical cost including ozone operation for ~1 log crypto inactivation.**

- Mazloum, S, et al., "Improvement and Optimization of the A. H. Weeks Water Treatment Plant Processes, Windsor, ON, Canada", Ozone Science and Engineering, 26:2, 125 – 140, April 2004.

# Bottom line

Many different ways to treat HAB byproducts

(Ozone, PAC, GAC, AOP, permanganate, chlorine, etc.)

Best solution includes site-specific considerations/testing

**Managing Algal Blooms in Drinking Water Sources - Treatment Plant Approaches**

Scott Bindner

October 16, 2019

# Agenda

- Review of UV Advanced Oxidation Science
- Applications for Taste and Odor and Algal Toxin Treatment
- Life-Cycle
- Case Studies
- Summary
- Other UV AOP Applications

# UV Advanced Oxidation Process (UV AOP)

Using UV and hydrogen peroxide to destroy trace organic contaminants in water by:

UV-Photolysis

UV-Oxidation

# UV-Photolysis

**Chemical Bonds are Broken by UV Light**

# UV-Oxidation Reaction Mechanisms

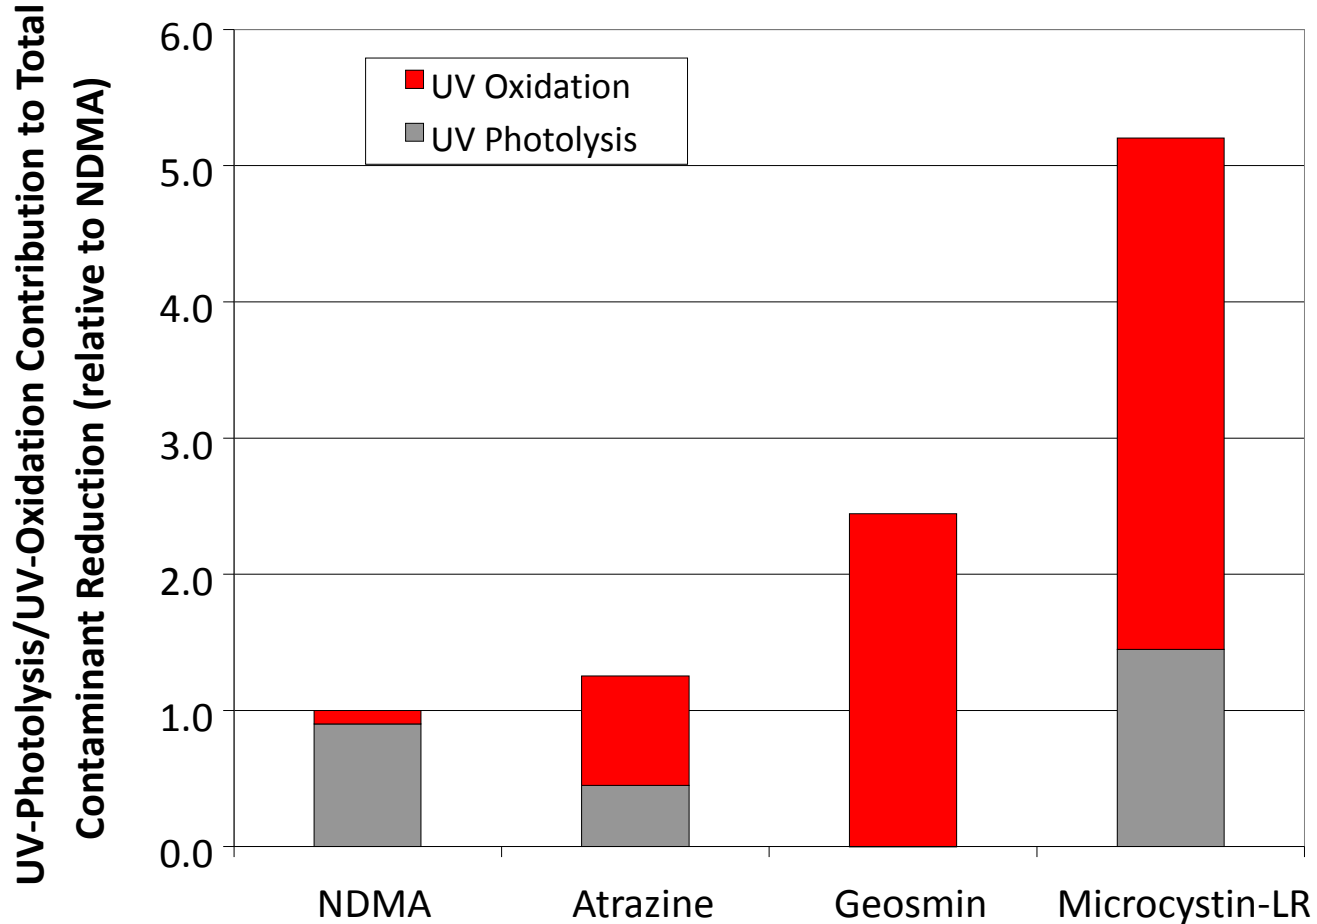

- UV light is absorbed by hydrogen peroxide:

- Degradation rate depends on:
  - Lamp type
  - Absorption of water background (UVT)
  - Hydroxyl radical ( $\bullet\text{OH}$ ) rate constant  $k_{\text{OH,C}}$
  - $\text{H}_2\text{O}_2$  concentration
  - Hydroxyl radical scavenging demand

# Contaminant Destruction Balance

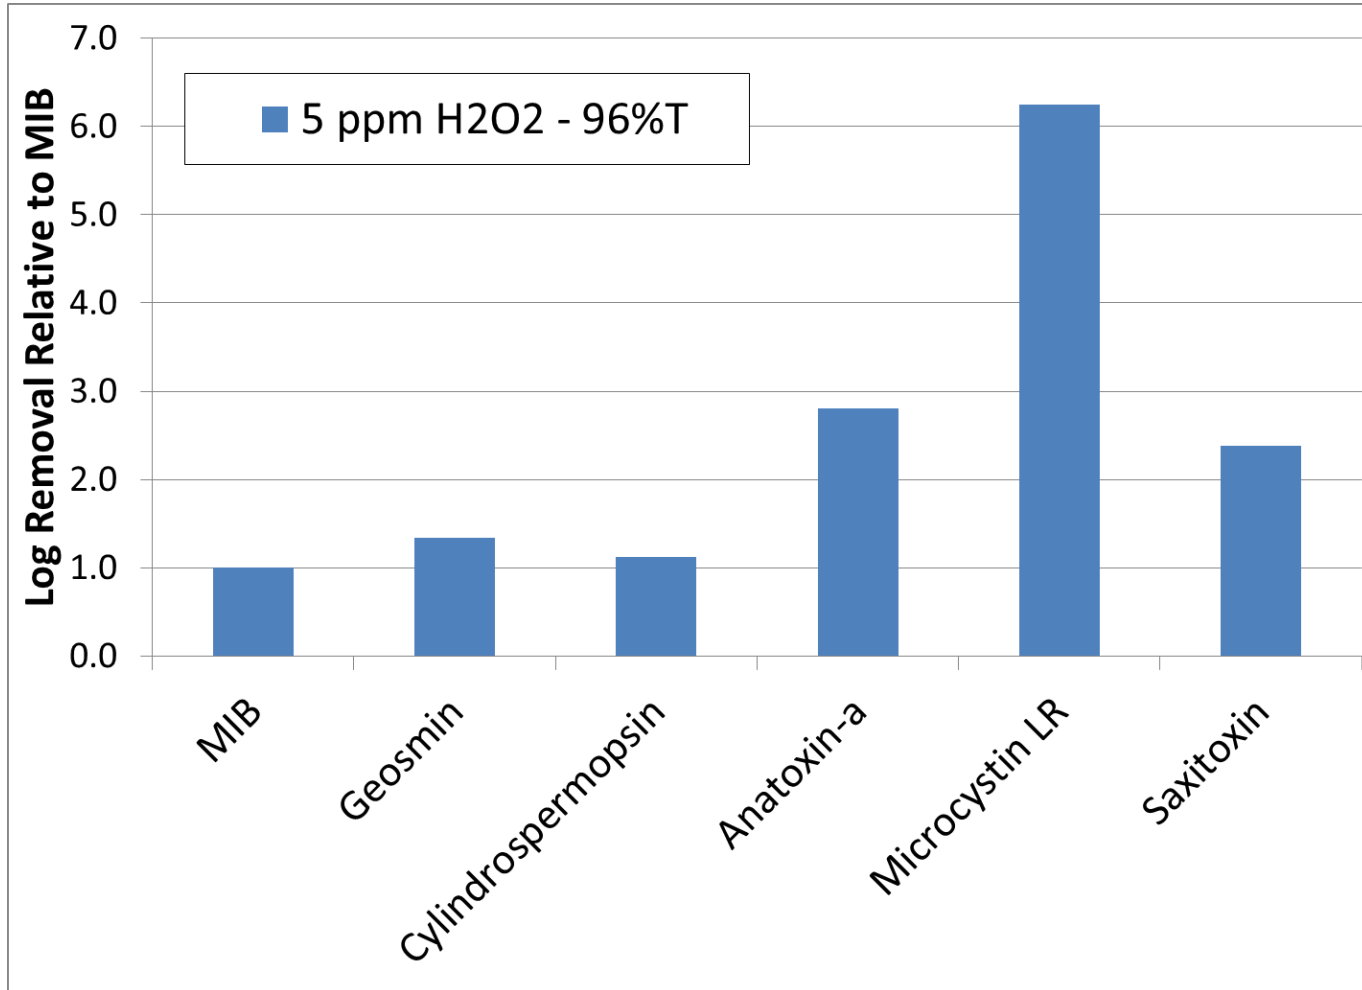

# Algal Toxins

- Algal toxins and their toxicity mode:

Name of Toxin	Type of Toxin	Affected Area
Cylindrospermopsin	Cytotoxin	Liver, Kidney
Microcystin	Hepatotoxin	Liver
Saxitoxin	Neurotoxin	Nervous System
Anatoxin	Neurotoxin	Nervous System
Lipopolysaccharides	Endotoxin	Skin

# Algal Toxins Oxidize more Easily than T&O Molecules

# Dual-Mode Operation

# Quenching

- $H_2O_2$  is not a highly efficient absorber of UV-light
- Most  $H_2O_2$  dosed into a UV-AOP system is not converted to radicals
- Quenching residual  $H_2O_2$  typically needed for most municipal facilities

	Free Chlorine	Activated Carbon
Advantages	<ul style="list-style-type: none"> <li>• Less expensive</li> <li>• Maintain secondary residual</li> </ul>	<ul style="list-style-type: none"> <li>• Simple and efficient</li> <li>• Low EBCT and infrequent replacement (catalysis)</li> </ul>
Disadvantages	<ul style="list-style-type: none"> <li>• Challenging to manage dose</li> </ul>	<ul style="list-style-type: none"> <li>• More costly</li> </ul>

# UV AOP Cost Comparison

- Design Flow: 30 MGD
- Length of T&O Event: 16 Weeks
- T&O Target: 1-Log Geosmin (During Event Only)
- Disinfection Target: 3-Log *Cryptosporidium* (All Year)
- Facility Lifetime: 20 Years

# UV AOP Carbon Footprint

- Design Flow: 30 MGD
- Length of T&O Event: 16 Weeks
- T&O Target: 1-Log Geosmin (During Event Only)
- Disinfection Target: 3-Log *Cryptosporidium* (All Year)
- Facility Lifetime: 20 Years

Swaim, et al., 2011

# CASE STUDY

## Lorne Park WTP, Peel Region

- Flow rate = 103 MGD
- Algal blooms in late summer/early autumn
- Designed for 0.7 log reduction of geosmin
- System provides disinfection in addition to UV AOP (*Cryptosporidium* barrier)
- Both UV-oxidation and ozone technologies were evaluated
- UV-oxidation was ultimately selected due to its:
  - Smaller footprint
  - Safety (no liquid oxygen required on site)
  - Simplicity

# CASE STUDY

## Regional Municipality of West Elgin

- Source water is Lake Erie
- Flow rate 3.8 MGD (14.4 MLD)
- Treatment train: Screen filtration → Microfiltration → UV-oxidation → final disinfection (Chlorine Quenching)
- Algal blooms in late summer/early fall
- Previously used Powder Activated Carbon for T&O
- Designed for 1.3-log geosmin and 1.0-log MIB
- Operates September through October

# CASE STUDY

## Regional Municipality of West Elgin

# Plants Recently Selecting UV AOP

Treatment Plant Location	Design Flow (MGD)	Target
Groesbeck, TX	2	1-Log Geosmin
Waxahachie, TX	14	1.4-Log Geosmin
Mansfield, TX	7.5	1-Log Geosmin
Patoka Lake, IN	10	1.5-Log Geosmin
Neshaminy, PA	15	1.0-Log Geosmin
Lucerne, CA	1	1.3-Log Geosmin
Lorne Park, ON (Canada)	103	3-Log Geosmin & 1-Log MIB
Chicoutimi Nord, QC (Canada)	2	1-Log Geosmin
PWN (The Netherlands)	63	0.7-Log Atrazine (Pesticide)
Aurora Reservoir, CO	50	Various Contaminants

# Benefits Summary

- Small physical footprint
- Less expensive than ozone
- Provides superior third-party validated disinfection
- Always ready: can't be exhausted or degraded (as GAC can be)
- Flexible: if no T&O event, O&M costs are ~1 cent/1,000 gallons
- Can be retrofitted into existing plants
- No bromate formation
- Also capable of removing algal toxins in addition to T&O
